Summary

A flush trim guide big enough to allow handheld routers' sub bases to ride on it and leave enough room for you to hold.

[Hobby & Makers](#) > [Tools](#)

All existing designs I've found on the internet have very short handles which are nice for router tables, but when you use a handheld router, the subbase covers most if not all of the jig so you can't access the jig to keep it tight against the work piece

This design has a large handle so you have enough room to grab the jig.

fusion f3d file included so you can modify the model as you like.
